

CLAIM AMENDMENTS

Please amend the claims as follows:

Please cancel claims 1-249.

Please add new claims 250-283 as follows:

250.(New) A method for interfacing between a terminal and a core network connected to the radio network, wherein the terminal has a hybrid operating type being possible to be set as either a synchronous operating type or an asynchronous operating type and the core network has a synchronous operating type, the method comprising the steps of:

a) recognizing an operating type of the core network on the basis of a core network operating type information contained in a message, to thereby allow the terminal to operate according to the recognized operating type of the core network.

251.(New) The method as recited in claim 250, after the step a), further comprising the step b) of storing the recognized operating type of the core network.

252.(New) The method as recited in claim 250, wherein the step a) includes the steps of:

a1) receiving the message having the core network operating type information in a predetermined location through a predetermined channel;

a2) extracting the core network operating type information from the received message; and

a3) setting an operating type of the terminal to the synchronous operating type or the asynchronous operating type on the basis of the recognized operating type of the core network.

253.(New) The method as recited in claim 252, wherein the predetermined channel is a synchronous channel.

254.(New) The method as recited in claim 252, wherein the predetermined location is a core network type information field of a synchronous channel message.

255.(New) The method as recited in claim 250, wherein the core network operating type information includes an ANSI-41 information representing a synchronous type core network.

256.(New) The method as recited in claim 250, wherein the message includes a master information block.

257.(New) The method as recited in claim 250, wherein the message includes a system information message.

258.(New) The method as recited in claim 250, wherein the message is represented by:

INFORMATION ELEMENT	PRESENCE	MULTI	IE TYPE AND REFERENCE	SEMANTICS DESCRIPTION
OTHER INFORMATION ELEMENTS				
MIB VALUE TAG	M			
REFERENCES TO OTHER SYSTEM INFORMATION BLOCKS		1.. <MAX SYS INFO BLOCK COUNT>		
>SCHEDULING INFORMATION	M			
CN INFORMATION ELEMENTS				
CN TYPE	M		ANSI-41	
ANSI-41 INFORMATION ELEMENTS	C-ANSI			

CONDITION	EXPLANATION
GSM	THIS INFORMATION ELEMENT SHALL BE PRESENT IN CASE (CN TYPE == " GSM-MAP") OR (CN TYPE == "GSM-MAP AND ANSI-41")
ANSI	THIS INFORMATION ELEMENT SHALL BE PRESENT IN CASE (CN TYPE == " ANSI-41") OR (CN TYPE == "GSM-MAP AND ANSI-41")

259.(New) An apparatus for interfacing between a terminal and a core network connected to the radio network, wherein and the terminal has a hybrid operating type being possible to be set as either a synchronous operating type or an asynchronous operating type and the core network has a synchronous operating type, said apparatus comprising:

detection means for recognizing an operating type of the core network on the basis of a core network operating type information in a message; and

setting means for setting an operating type of the terminal to one of the synchronous operating type and the asynchronous operating type on the basis of the recognized operating type of the core network.

260.(New) The apparatus as recited in claim 259, further comprising a storage device for storing the recognized operating type of the core network.

261.(New) The apparatus as recited in claim 259, wherein the detection means includes:

receiver means for receiving the message having the core network operating type information in a predetermined location through a predetermined channel; and

extraction means for extracting the core network operating type information from the received message.

262.(New) The apparatus as recited in claim 261, wherein the predetermined channel is a synchronization channel.

263.(New) The apparatus as recited in claim 261, wherein the predetermined location is a core network type information field of a synchronous channel message.

264.(New) The apparatus as recited in claim 259, wherein the core network operating type information includes ANSI-41 information representing a synchronous type core network.

265.(New) The apparatus as recited in claim 259, wherein the message includes a master information block.

266.(New) The apparatus as recited in claim 259, wherein the message includes a system information message.

267.(New) The apparatus as recited in claim 259, wherein the message is represented by:

INFORMATION ELEMENT	PRESENCE	MULTI	IE TYPE AND REFERENCE	SEMANTICS DESCRIPTION
OTHER INFORMATION ELEMENTS				
MIB VALUE TAG	M			
REFERENCES TO OTHER SYSTEM INFORMATION BLOCKS		1.. <MAX SYS INFO BLOCK COUNT>		
>SCHEDULING INFORMATION	M			
CN INFORMATION ELEMENTS				
CN TYPE	M		ANSI-41	
ANSI-41 INFORMATION ELEMENTS	C-ANSI			

CONDITION	EXPLANATION
GSM	THIS INFORMATION ELEMENT SHALL BE PRESENT IN CASE (CN TYPE == " GSM-MAP") OR (CN TYPE == "GSM-MAP AND ANSI-41")
ANSI	THIS INFORMATION ELEMENT SHALL BE PRESENT IN CASE (CN TYPE == " ANSI-41") OR (CN TYPE == "GSM-MAP AND ANSI-41")

268.(New) A method for interfacing between a terminal and a core network connected to a radio network, wherein the terminal has a hybrid operating type being possible to be set as either a synchronous operating type or an asynchronous operating type and the core network has an asynchronous operating type, the method comprising the steps of:

a) recognizing an operating type of the core network on the basis of a core network operating type information contained in a message, to thereby allow the terminal to operate according to the recognized operating type of the core network.

269.(New) The method as recited in claim 268, after the step a), further comprising the step b) of storing the recognized operating type of the core network.

270.(New) The method as recited in claim 268, wherein the step a) includes the steps of:

a1) receiving the message having the core network operating type information through a predetermined channel;

a2) extracting the core network operating type information from the received message; and

a3) setting an operating type of the terminal to the synchronous operating type or the asynchronous operating type on the basis of the recognized operating type of the core network.

271.(New) The method as recited in claim 270, wherein the predetermined channel is a broadcast control channel.

272.(New) The method as recited in claim 268, wherein the core network operating type information is a GSM-MAP information representing an asynchronous type core network.

273.(New) The method as recited in claim 268, wherein the message includes a master information block.

274.(New) The method as recited in claim 268, wherein the message includes a system information message.

275.(New) The method as recited in claim 268, wherein the message is represented by:

INFORMATION ELEMENT	PRESENCE	MULTI	IE TYPE AND REFERENCE	SEMANTICS DESCRIPTION
OTHER INFORMATION ELEMENTS				
MIB VALUE TAG	M			
REFERENCES TO OTHER SYSTEM INFORMATION BLOCKS		1.. <MAX SYS INFO BLOCK COUNT>		

>SCHEDULING INFORMATION	M			
CN INFORMATION ELEMENTS				
CN TYPE	M		GSM-MAP	
PLMN IDENTITY	C-GSM			

CONDITION	EXPLANATION
GSM	THIS INFORMATION ELEMENT SHALL BE PRESENT IN CASE (CN TYPE == " GSM-MAP") OR (CN TYPE == "GSM-MAP AND ANSI-41")
ANSI	THIS INFORMATION ELEMENT SHALL BE PRESENT IN CASE (CN TYPE == " ANSI-41") OR (CN TYPE == "GSM-MAP AND ANSI-41")

276.(New) An apparatus for interfacing between a terminal and a core network connected to a radio network, wherein and the terminal has a hybrid operating type being possible to be set as either a synchronous operating type or an asynchronous operating type and the core network has an asynchronous operating type, comprising:

detection means for recognizing an operating type of the core network on the basis of a core network operating type information in a message; and

setting means for setting an operating type of the terminal to one of the synchronous operating type and the asynchronous operating type on the basis of the recognized operating type of the core network.

277.(New) The apparatus as recited in claim 276, further comprising a storage device for storing the recognized operating type of the core network.

278.(New) The apparatus as recited in claim 276, wherein the detection means includes:

receiver means for receiving the message having the core network operating type information through a predetermined channel; and

extraction means for extracting the core network operating type information from the received message.

279.(New) The apparatus as recited in claim 276, wherein the predetermined channel is a broadcast control channel.

280.(New) The apparatus as recited in claim 276, wherein the core network operating type information is a GSM-MAP information representing an asynchronous type core network.

281.(New) The apparatus as recited in claim 276, wherein the message includes a master information block.

282.(New) The apparatus as recited in claim 276, wherein the message includes a system information message.

283.(New) The apparatus as recited in claim 276, wherein the message is represented by:

INFORMATION ELEMENT	PRESENCE	MULTI	IE TYPE AND REFERENCE	SEMANTICS DESCRIPTION
OTHER INFORMATION ELEMENTS				
MIB VALUE TAG	M			
REFERENCES TO OTHER SYSTEM INFORMATION BLOCKS		1.. <MAX SYS INFO BLOCK COUNT>		
>SCHEDULING INFORMATION	M			
CN INFORMATION ELEMENTS				
CN TYPE	M		GSM-MAP	
PLMN IDENTITY	C-GSM			

CONDITION	EXPLANATION
GSM	THIS INFORMATION ELEMENT SHALL BE PRESENT IN CASE (CN TYPE == " GSM-MAP") OR (CN TYPE == "GSM-MAP AND ANSI-41")
ANSI	THIS INFORMATION ELEMENT SHALL BE PRESENT IN CASE (CN TYPE == " ANSI-41") OR (CN TYPE == "GSM-MAP AND ANSI-41")
